Linux Privilege Escalation

Presented By: Hassan Al Achek

What is the goal of privilege escalation?

- Our ultimate goal with privilege escalation in Linux is to gain a shell running as the <u>root</u> user.
- Privilege escalation can be simple (e.g. a kernel exploit) or require a lot of reconnaissance on the compromised system.

Understanding Permissions in Linux:

permissions in Linux is a relationship between users, groups, files and directories.

- users: multiple groups
- groups: multiple users

Every file and directory defines its permissions in terms of a user, a group, and "others" (all users).

Users:

- The core of the Linux security system is the user account
- Each individual who accesses a Linux system should have a unique user account assigned
- The users' permissions to objects on the system depend on the user account they log in with
- User permissions are tracked using a user ID (often called a UID), which is assigned to an account when it's created
- The Linux system uses special files and utilities to track and manage user accounts on the system.
- The root user is a special type of account in linux system (with UID 0)

/etc/passwd file

```
File: /etc/passwd
 1
       root:x:0:0:root:/root:/bin/bash
2
       daemon:x:1:1:daemon:/usr/sbin:/usr/sbin/nologin
 3
      bin:x:2:2:bin:/bin:/usr/sbin/nologin
 4
      sys:x:3:3:sys:/dev:/usr/sbin/nologin
 5
      sync:x:4:65534:sync:/bin:/bin/sync
 6
       games:x:5:60:games:/usr/games:/usr/sbin/nologin
       man:x:6:12:man:/var/cache/man:/usr/sbin/nologin
 8
       lp:x:7:7:lp:/var/spool/lpd:/usr/sbin/nologin
9
       mail:x:8:8:mail:/var/mail:/usr/sbin/nologin
10
       news:x:9:9:news:/var/spool/news:/usr/sbin/nologin
11
       uucp:x:10:10:uucp:/var/spool/uucp:/usr/sbin/nologin
      proxy:x:13:13:proxy:/bin:/usr/sbin/nologin
12
13
       www-data:x:33:33:www-data:/var/www:/usr/sbin/nologin
14
       backup:x:34:34:backup:/var/backups:/usr/sbin/nologin
15
       list:x:38:38:Mailing List Manager:/var/list:/usr/sbin/nologin
16
       irc:x:39:39:ircd:/run/ircd:/usr/sbin/nologin
17
       gnats:x:41:41:Gnats Bug-Reporting System (admin):/var/lib/gnats:/usr/sbin/nologin
18
       nobody:x:65534:65534:nobody:/nonexistent:/usr/sbin/nologin
19
        apt:x:100:65534::/nonexistent:/usr/sbin/nologin
20
       systemd-timesync:x:101:102:systemd Time Synchronization,,,:/run/systemd:/usr/sbin/nologin
       systemd-network:x:102:103:systemd Network Management,,,:/run/systemd:/usr/sbin/nologin
21
22
      systemd-resolve:x:103:104:systemd Resolver,,,:/run/systemd:/usr/sbin/nologin
       mysql:x:104:110:MySQL Server,,,:/nonexistent:/bin/false
23
24
       tss:x:105:111:TPM software stack,,,:/var/lib/tpm:/bin/false
25
      strongswan:x:106:65534::/var/lib/strongswan:/usr/sbin/nologin
26
      ntp:x:107:112::/nonexistent:/usr/sbin/nologin
27
       messagebus:x:108:113::/nonexistent:/usr/sbin/nologin
28
      redsocks:x:109:114::/var/run/redsocks:/usr/sbin/nologin
```

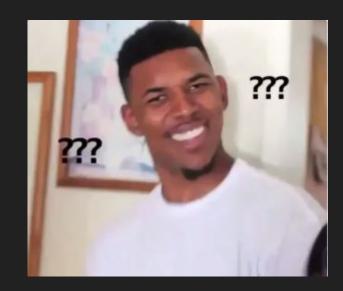

/etc/passwd

/etc/shadow

But wait Hassan, is the password 'x' for all users

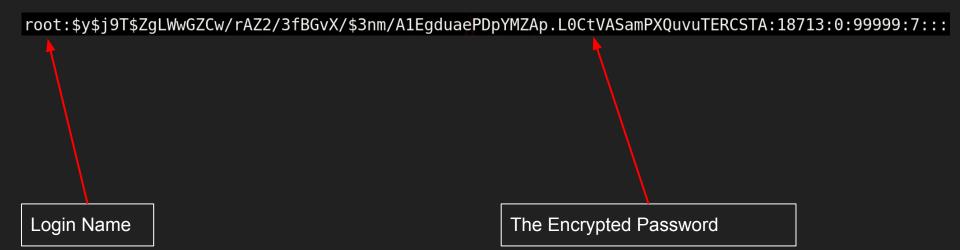

:) wait let's discuss the /etc/shadow

/etc/shadow

```
File: /etc/shadow
root:$y$j9T$ZgLWwGZCw/rAZ2/3fBGvX/$3nm/A1EgduaePDpYMZAp.L0CtVASamPXQuvuTERCSTA:18713:0:99999:7:::

```

/etc/shadow

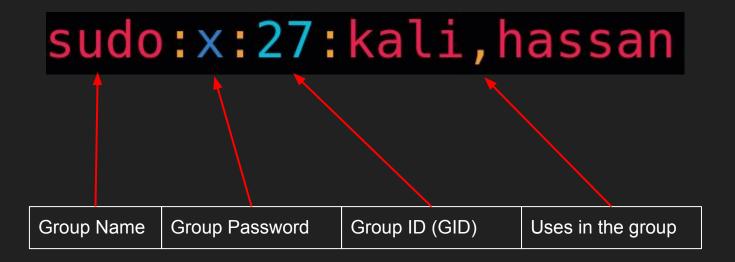

Groups

- Group permissions allow multiple users to share a common set of permissions for an object on the system, such as a file, directory, or device
- Each group has a unique GID, which, like UIDs, is a unique numerical value on the system. Along with the GID, each group has a unique group name.
- Groups are configured in the /etc/group file

```
root:x:0:
                         1 daemon:x:1:
                         2 bin:x:2:
/etc/group
                         3 sys:x:3:
                         4 adm:x:4:
                         5 tty:x:5:
                         6 disk:x:6:
                         7 lp:x:7:
                         8 mail:x:8:
                         9 news:x:9:
                        10 uucp:x:10:
                        11 man:x:12:
                        12 proxy:x:13:
                        13 kmem:x:15:
                        14 dialout:x:20:
                        15 fax:x:21:
                        16 voice:x:22:
                        17 cdrom:x:24:kali
                        18 floppy:x:25:kali
                        19 tape:x:26:
                        20 sudo:x:27:kali,hassan
                        21 audio:x:29:pulse,kali
                        22 dip:x:30:kali
                        "/etc/group" [readonly] 94L, 1385B
```

/etc/group

Note: The group password allows a non-group member to temporarily become a member of the group by using the password.

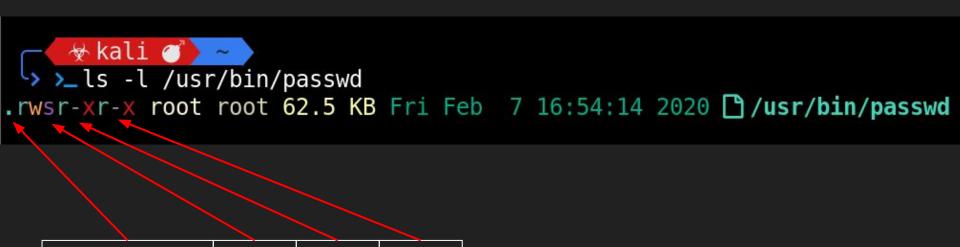

Files

To list file permission we will use Is -I command

```
drwxr-xr-x kali kali

Files

- file, d directory

others

Note: Only owner of the file can change permissions
All files & directories have a single owner and a group

group

owner

File Permissions

Read - r - when set, the file contents can be read

Write - w - when set, the file contents can be modified

Execute - x - when set, the file can be executed (i.e. run as some kind of process)

Directory Permission

Execute – when set, the directory can be entered. Without this permission, neither the read nor write permissions will work

Read – when set, the directory contents can be listed

Write – when set, files and subdirectories can be created in the directory

SUID and SGID

- The set user id (SUID): When a file is executed by a user, the program runs under the permissions of the file owner.
- The set group id (SGID): For a file, the program runs under the permissions of the file group. For a directory, new files created in the directory use the directory group as the default group.
- SUID/SGID permissions are represented by an 's' in the execute position.

Real, Effective, and Saved UID/GID

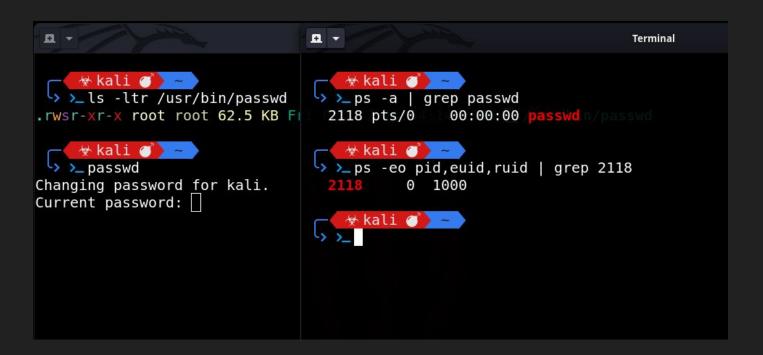

- Each user has three user IDs in Linux (real, effective, and saved)
- Real user ID: is who they actually are (check /etc/passwd)
- Effective user ID: is normally equal to their real ID, however when executing a
 process as another user, the effective ID is set to that user's real ID.
- the effective ID is used in most access control decisions to verify a user, and commands such as whoami use the effective ID.
- Saved user ID: is used to ensure that SUID processes can temporarily switch a user's effective ID back to their real ID and back again without losing track of the original effective ID.

Print real and effective user / group IDs:

Print real, effective, saved, and file system user / group IDs of the current process (i.e. our shell):

Viewing Permission

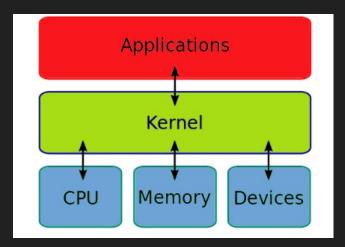

EUID and RUID

Kernel Exploitation

What is Kernel?

- Kernels are the core of any operating system.
- Think of it as a layer between application software and the actual computer hardware.
- The kernel has complete control over the operating system.
- Exploiting a kernel vulnerability can result in execution as the root user.

How To Find Kernel Exploitation?

- Enumeration of kernel version (uname -a)
- Search for exploit (google, exploit database, or using searchsploit)
- 3. Compile and run
- Get Root privilege or Crash the system :)

Enumeration

Searchsploit

Dirty Pipe - CVE-2022-0847

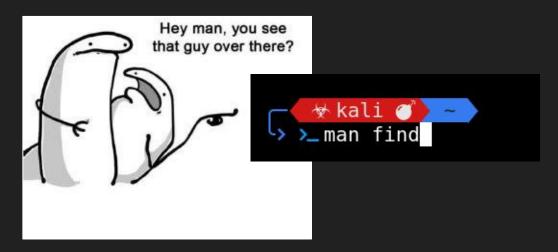

Weak File Permissions

- Certain system files can be taken advantage of to perform privilege escalation if the permissions on them are too weak.
- If a system file has confidential information we can read, it may be used to gain access to the root account.
- If a system file can be written to, we may be able to modify the way the operating system works and gain root access that way.

Find Command And Manual Enumeration

Find Command And Manual Enumeration

- 1. Find writable file: find /etc -maxdepth 1 -writable -type f
- 2. Find readable file: find /etc -maxdepth 1 -readable -type f
- 3. Find all directories which can be written to:

find / -executable -writable -type d 2> /dev/null

Readable /etc/shadow

- By Default Readable by root only
- If we are able to read the content of /etc/shadow
- We can try to crack the hash of the root user.
- Using HashCat or John

john --format=sha512crypt --wordlist=/usr/share/wordlists/rockyou.txt hash.txt

Readable /etc/shadow

- ~# unshadow passwd shadow > crackme
- ~# john --wordlist<=custom wordlist file> <file to crack>
- ~# john --wordlist=/usr/share/wordlists/rockyou.txt crackme

	crac	

kali:\$6\$pPKWGpwcuEgo0F0z\$GFSBP6xJLpcTZlBwyo.RbRRitHXZ6HZeSsQPSP4xrBYRAce.iqshkVcDjgod5LpF80YPdBRRdc11zE.s0rcAF.:1000:1000:,,,:
/home/kali:/bin/bash

Readable /etc/shadow

kali:kali:1000:1000:,,,:/home/kali:/bin/bash

1 password hash cracked, 0 left

Writable /etc/shadow

Generate a new SHA-512 password hash:

~# mkpasswd -m sha-512 newpassword

Edit the /etc/shadow and replace the root user's password hash with the one we generated.

~# su #switch user

kali:\$6\$pPKWGpwcuEgoOF0z\$GFSBP6xJLpcTZlBwyo.RbRRitHXZ6HZeSsQPSP4xrBYRAce.iqshkVcDjgod5LpF8OYPdBRRdc11zE.s0rcAF.:18393:0:99999:7:::

Sudo

What is sudo?

sudo is a program which let users run other programs with the security privileges of other user. By default, that other user will be root.

A user generally needs to enter their password to use sudo, and they must be permitted access via rule(s) in the /etc/sudoers file.

List programs a user is allowed (and disallowed) to run:

```
~$ sudo -l
```

```
> access security grid
access: PERMISSION DENIED.
> access main security grid
access: PERMISSION DENIED....and...
YOU DIDN'T SAY THE MAGIC WORD!
```

Known Password

~\$ sudo su

Password:

~# whoami

Root

~#

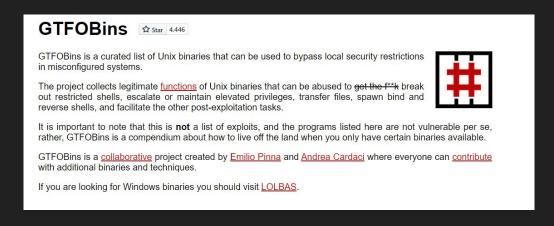

If su program is not allowed

```
~$ sudo -s  # -s for shell
~$ sudo -i  # -i run login shell as the target user
~$ sudo /bin/bash  # run the /bin/bash
~$ sudo passwd  # passwd run passwd
```

Shell Escape Sequences

GTFOBins

Even if we are restricted to running certain programs via sudo, it is sometimes possible to "escape" the program and spawn a shell.

SUID and SGID Executable

SUID files get executed with the privileges of the file owner.

SGID files get executed with the privileges of the file group.

If the file is owned by root, it gets executed with root privileges, and we may be able to use it to escalate privileges.

We can use the following find command to locate files with the SUID or SGID bits set:

~\$ find / -type f -a \(-perm -u+s -o -perm -g+s \) -exec Is -I {} \; 2> /dev/null

Cron Jobs

Cron jobs are programs or scripts which users can schedule to run at specific times or intervals.

Cron jobs run with the security level of the user who owns them.

By default, cron jobs are run using the /bin/sh shell, with limited environment variables.

Cron Jobs

Cron table files (crontabs) store the configuration for cron jobs.

User crontabs are usually located in /var/spool/cron/ or /var/spool/cron/crontabs/

The system-wide crontab is located at /etc/crontab.

File Permissions

Misconfiguration of file permissions associated with cron jobs can lead to easy privilege escalation.

If we can write to a program or script which gets run as part of a cron job, we can replace it with our own code.

View the contents of the system-wide crontab:

~# cat /etc/crontab

Try Hack Me Room

https://tryhackme.com/room/linuxprivesc

- 1. Create Account
- 2. Download Vpn Configuration File
- 3. Run sudo openvpn username.ovpn
- 4. Verify Connection by typing ifconfig tun0 or ip a show dev tun0
- 5. SSH: ssh username@targetlp then enter password
- 6. Get SSH Session Enjoy;)

Thanks You:)
